Fig-6: Pump Selection at Rated flow, BEP between Normal and Rated

As seen from the Fig-6, Rated flow point is on right side of the BEP. When pump flow is regulated from Rated Point to a lower flow rate or the Normal flow point, the operating point either moves towards or remains in a close proximity to the BEP. On the other hand, when pump flow rate is regulated from Normal flow point towards Rated flow point, the operating point moves in closer proximity to the BEP (see indication by blue arrows in Figure-6 above).

On the contrary, if we select a pump which does not have BEP between Normal flow point and Rated flow point, the flow regulation between Normal and Rated flow moves the operating point such that it never comes any further closer to the BEP (see indication by blue arrows in Figure-7 below).

Fig-7: Pump Selection at Rated flow, BEP is NOT between Normal and Rated
